

Psychopathology, problem behaviour and burden in schizophrenia: Relationship between psychopathology and problem behaviour of schizophrenic patients and burden experienced by primary caregivers

The recent trend towards community psychiatry appears to have shifted much of the burden of care of the chronically mentally ill from the institutions to the family. This book provides the data on the relationship between psychopathology and problem behaviour of schizophrenic patients and burden imposed on their primary caregivers. Patients psychopathology and problem behaviour were assessed using Positive and Negative Syndrome Scale (PANSS) and Social Behaviour Schedule (SBS) respectively. Caregivers amount of burden was assessed using Burden on Family Interview Schedule (BFS). This book provides good references for professionals, undergraduate as well as postgraduate students in the field of psychiatry and psychology.
