

Транскрипционная активность в генетических локусах E.coli: содерzhashchikh potentsialnye promotory dlya sinteza antismyslovykh RNK (Russian Edition)

Regulyatsiya ekspressii bakterialnykh genov mozhет osushchestvlyatsya na neskol'kikh funktsionalnykh urovnyakh. V pervuyu ochered, v protsesse initsiatsii transkripsii. Traditsionno schitaetsya, что эффективность синтеза РНК контролируется белками активаторами и репрессорами обshchee chislo kotorykh v bakterialnoy kletke mozhет byt okolo 300. Krome того, sushchestvuet eshche odin klass regulyatorov malye netransliruemye РНК. Ikh razmer variruet ot 37 do 400 nukleotidov, a mekhanizmy deystviya ochen raznoobrazny. Dlya E.coli v nastoyashchee vremya izucheno 87 regulyatornykh РНК, bolshaya chast kotorykh kodiruyetsya nezavisimymi genami. Dannye sistemnogo analiza pozvolyayut predpolozhit, что obshchee ikh kolichestvo v kletke gorazdo bolshe, chem belkovykh regulyatorov transkripsii. Pri etom tolko 10 izvestnykh netransliruemykh РНК transkribiruyutsya iz kodiruyushchikh posledovatelnostey v antismyslovom napravlenii. Obrazuya komplementarnye dupleksy s mРНК vblizi initsiiruyushchego kodona, oni vliyayut na ikh assotsiatsiyu s ribosomami i, sledovatelno, moduliruyut sintez belkovogo produkta. Pri svyazyvanii s drugimi uchastkami matrichnoy РНК, aРНК mogut izmenyat ikh stabilnost, podderzhivaya odnositelnoe sodержanie mРНК na optimalnom urovne.
